

Python Programming

Features: High-Level, Object Oriented, Interpreted, Dynamic Semantics

Flexible, Open-Source

Most used in DS and AI/ML

Libraries - Different functions for special needs are available in python

Editor - IDLE, Jupyter notebook, PyCharm

File format- .py, .ipynb - Notebook file format

Python - Variables, Data Types

```
print("Welcome to Python Class")  
print('Welcome to India')
```

```
Welcome to Python Class  
Welcome to India
```

String Print

```
1 print(30)
2 print(4.5)
3 #This is not gonna print
```

```
30
4.5
```

Number Print and a comment

```
1 print("Dumb", "Ways", "to", "Die", sep="_")
```

```
Dumb_Ways_to_Die
```

Separator using an underscore

Variable is a reserved memory space for storing characters, integers or boolean .

A variable mustn't start with numbers.

It can start with alphanumeric characters and underscore (A-Z, a-z, _, and 0-9)

It cannot be a keyword. Eg: int, sum, float, print

Good variable name: choose a meaningful name instead of short name.

roll_number is better than rn.

Variable printing of character, integer

```
1 name = "Abhiram S"
2 age = 21
3 cgpa = 6.5
4 university = "KTU"
5 place = "Karamana"
6 height = "176"
7 print("Name:", name, ",Age:", age, ",CGPA:", cgpa, ",University:", university, ",Place:", place, ",Height:", height)
```

```
Name: Abhiram S ,Age: 21 ,CGPA: 6.5 ,University: KTU ,Place: Karamana ,Height: 176
```

```
1 print(f"Iam {name} from {place}. I am {age} years old. I graduated from {university} with {cgpa} CGPA")
```

```
Iam Abhiram S from Karamana. I am 21 years old. I graduated from KTU with 6.5 CGPA
```

Input Function

```
1 name = input("Enter your name:")
2 print(f"Oh, You are {name}!!!!")
```

```
Enter your name:Abhiram
Oh, You are Abhiram!!!!
```

```
1 name = input("Hey there, your sweet name please:")
2 print(f" Good to see you {name}")
3 drink = input("What do you want to drink today? ")
4 number = input("How much? ")
5 print(f"Good choice, Fetching a {number} cups of {drink} for {name}. Coming right up.....")
6 print(f"Enjoy your beverage, and thanks for choosing Chayakada")
```

```
Hey there, your sweet name please:abhiran
Good to see you abhiran
What do you want to drink today? iced tea
How much? 3
Good choice, Fetching a 3 cups of iced tea for abhiran. Coming right up.....
Enjoy your beverage, and thanks for choosing Chayakada
```

Defining data type

```
1 cgpa = float(input("Enter your cgpa"))
2 print(f"Your CGPA is {cgpa}")
3 type (cgpa)
```

```
Enter your cgpa6.7
Your CGPA is 6.7
float
```

Filetype: text.endswith()

OPERATORS

add. sub, multiplication, and division

LOGICAL OPERATORS

and, or, not
